

Introduction, Roles and Responsibilities

Self-Introduction:

Hi, I'm [Your Name] from [Your City]. I am currently working as an **Associate in Programmatic Advertising**. And explain about **previous experience**. I've graduated from [Your College] in **2019 (Year of passing)**, and I've specialized in leveraging data-driven strategies to optimize digital campaigns.

Roles & Responsibilities

Each day, we focus on tasks such as uploading campaign creatives and managing reporting responsibilities. When a request comes in for a new campaign launch, we receive a detailed campaign brief along with the Insertion Order (IO). We thoroughly review both the brief and the IO to ensure they align. If we notice any discrepancies, we promptly escalate the issue to the account manager for resolution.

Once everything is in order, we proceed with setting up the campaign. After completing the campaign setup, we pass it on for quality assurance (QA) to ensure all elements are in place. Upon completion of the QA process, we notify the account manager and send the campaign details to the respective campaign manager.

Once the campaign is live, we actively monitor daily reports and generate various insights for both internal teams and clients. Additionally, we handle general queries, address reported issues both internally and externally, and run campaign reports as requested by the sales team.

Technical Topics and Question & Answers

Brand Safety

Brand safety is a practice implemented by advertisers and publishers to ensure that their brand is not associated with inappropriate, offensive, or harmful content. It is about ensuring that the ads appear in suitable environments to protect a brand's reputation. This involves avoiding controversial or unsafe content, aligning with brand values, excluding sensitive categories and protecting against ad fraud. Overall, it's about making smart choices to build trust and keep the brand's image positive.

For example, A car manufacturer might use brand safety measures to ensure their ads don't appear next to content about accidents, car crashes, or controversial political issues, as these could harm their image as a reliable, safe product.

Viewability

It is the percentage of ads that are actually visible to users in their browser. It tracks only the impressions that have the potential to be seen, rather than just being loaded in the background.

For example, an ad is considered "viewable" if at least half (50% of ad) of it is visible on the screen for a short time (like 1 second for display ads, 2 seconds for video ads).

Viewability Rate = (No of Viewable Impressions / No of Measurable Impressions) x 100.

Viewable Impressions: The number of times an ad was actually visible to users according to the viewability criteria (For example, 50% of the ad visible for 1 second).

Measurable/Served Impressions: The total number of times the ad was loaded or served, regardless of whether it was actually seen.

It tracks the occurrence of the ad being served or loaded, and can measure interactions such as clicks or conversions, but it doesn't guarantee visibility.

For example, An ad may be loaded on a webpage but placed below the fold or on a page the user quickly scrolls past — it's measurable, but may not have been seen.

Creative Weightage

Creative Weightage is value assigned to different ad creatives in a campaign based on their performance. It is used to determine how much influence or impact each ad creative has on the overall performance of the campaign.

Creative Weightage helps optimize ad performance by analyzing which creatives resonate best with the target audience. Advertisers may assign more weight to certain ad creatives based on their engagement, conversion rates, or other performance metrics.

It can also be used to test multiple versions of an ad (A/B testing) to see which performs best, allowing for better allocation of resources.

Recency

Recency refers to targeting users based on how recently they interacted with a brand or product. Ads are shown to users who have recently engaged with the brand, increasing the likelihood of conversion while their interest is still fresh.

In short, recency helps advertisers focus on users who are more likely to engage because they've shown interest recently.

Examples:

1. If someone visited an online store and added items to their cart but didn't buy, **recency** allows advertisers to show them ads for those same items soon after. This is because they are still "fresh" in the user's mind, and they are more likely to complete the purchase.
2. Another example is targeting users who watched a video ad for a product in the past 7 days, rather than someone who saw it months ago.

DEALS

1. Open Marketplace (Open/Public Auction) or Real-Time Bidding (RTB):

In this model, advertisers (buyers) and publishers (sellers) participate in auctions where ad inventory is sold in real-time to the highest bidder. Public real-time bidding auctions are open to all buyers and sellers, creating a transparent and competitive environment. Various advertisers can bid for available ad space, and the highest bid wins the opportunity to display their ad. This functions like an open marketplace where anyone can bid for ad placements. It is competitive, and the highest bidder secures the ad placement. However, advertisers have limited control over where their ads appear.

2. Private Marketplace (PMP) or Private Auction:

A Private Marketplace is an exclusive auction where only a select group of advertisers, chosen by the publisher, can participate. This creates a more controlled and targeted environment, offering a premium advertising experience and It is a relationship between a specific publisher and a selected group of advertisers.

3. Preferred Deal:

It is an agreement where an advertiser gets priority access to a publisher's ad inventory at a fixed price, but without a commitment to a specific number of impressions. It allows the advertiser to bid on premium ad space before it becomes available in the open marketplace. While impressions are not guaranteed, the deal offers a higher level of exclusivity and priority compared to a standard open auction.

4. Programmatic Guaranteed Deal (PG- Deal)

This is a direct and transparent agreement between a publisher and an advertiser. The publisher guarantees a specified volume of ad impressions, and in return, the advertiser commits to paying a fixed rate for these impressions. This deal ensures both parties are clear about the terms, with the advertiser receiving guaranteed ad space at a pre-negotiated price.

Summary of Deal Types:

Deals Type in Programmatic Advertising			
			
Open (RTB)	Private	Preferred	Direct
Known as RTB, Open Exchange, Open Marketplace	Known as Private Auction, Invitation Only Auction	Known as Preferred Deals, First Right of Refusal	Programmatic Guaranteed, Direct, Reserved, Premium
Competitive in Nature, Inventory is Unreserved	Inventory is Unreserved	Inventory is Unreserved	Inventory is Reserved
RTB Auction Open to All	Auction Based, One to Few Negotiated Bid Price	Fixed Pricing One to One Deal	Fixed Pricing One to One Deal
Dynamic Price Best to for Remnant inventory	Premium Inventory Before Open for all	Premium Inventory	Premium Inventory

1. **Open Auction (RTB)** – Real-time bidding in an open marketplace.
2. **Private Marketplace (PMP)** – Invitation-only auction for select advertisers.
3. **Preferred Deals** – Advertisers get priority access to inventory at a fixed price.
4. **Programmatic Guaranteed** – Fixed-price, guaranteed inventory deal.

Other Types:

5. **Automated Guaranteed** – Programmatic process for automated execution of guaranteed deals.
6. **Programmatic Direct (Non-Guaranteed)** – Direct deals without guaranteed impressions.
7. **Deal ID** – Unique identifier for private transactions.

Each of these deals offers different levels of control, flexibility, and automation, helping advertisers choose the best option for their campaigns depending on their needs and goals.

Auction Methods

First-Price Auction

In a first-price auction, the highest bidder wins and pays the exact price they bid for the ad placement. In this scenario, the bidder is charged the full bid amount.

Example: In a first-price auction, multiple bidders submit their bids simultaneously. The highest bidder wins and pays the exact price they bid. For example, if Bidder A bids \$2.20, Bidder B bids \$2.80, and Bidder C bids \$2.50, Bidder B wins and pays \$2.80.

Second-Price Auction

In a second-price auction, the highest bidder wins the ad space but pays \$0.01 more than the price of the second-highest bid. The winner does not pay their own bid but instead the second-highest bid plus \$0.01. This results in a final price that is usually lower than the highest bid.

Example: Bidder A bids \$2.20, Bidder B bids \$2.80 & Bidder C bids \$2.50. In this case, Bidder B wins the auction but pays the second-highest bid \$2.50, plus \$0.01, so Bidder B pays \$2.51.

Floor Price Auction

A floor price is the minimum amount an advertiser is willing to accept for an ad space set by the publisher. It ensures that no bid lower than the set floor price wins the auction. Ensures that the publisher does not sell inventory below a certain value.

Example: If a publisher sets a floor price of \$1.00 and Advertiser A bids \$0.80, Advertiser A will lose the auction because their bid is below the floor price.

Waterfall Bidding

Waterfall bidding is a sequential auction model where a publisher offers their ad inventory to one demand partner at a time until sold. If the first bidder doesn't buy the inventory, the next bidder in line gets the chance to bid, and so on.

Ad inventory is passed down to different bidders in a pre-determined order (through a list of demand sources like ad exchanges or networks) and each source bids for the inventory until it is sold.

Often used when publishers have prioritized relationships with specific ad networks or exchanges.

Header Bidding

Header bidding is a simultaneous auction method, where a publisher sends out bids to multiple demand partners at once (via a javascript in the website header), giving them an equal opportunity to bid for the ad inventory.

When a user visits a website, multiple demand sources (e.g., ad exchanges) submit bids for the available ad space simultaneously, and the highest bid wins.

It promotes increased competition by allowing more demand partners to participate, helping publishers maximize revenue.

Bid Shading

Bid shading is a technique used in first-price auctions where algorithms adjust the bid amount to minimize the cost for the buyer while still ensuring they win the auction. **(or)** Bid shading is a technique where the winning bid is adjusted to slightly above the second-highest bid (rather than paying the full bid). This helps advertisers save money while ensuring they still win the auction.

Bid shading relies on a predictive algorithm that analyzes historical data and real-time auction dynamics. Advertisers use this algorithm to fine-tune their bids, striking a balance between winning impressions and cost-effectiveness.

When DSPs implement bid shading, they analyze past winning bids to calculate an average between the lowest and highest bids on a given impression. This aims to prevent advertisers from overpaying for ad space.

The bid shading process can vary across different ad tech vendors, but the goal is always to determine a bid price that falls between the first-

price and second-highest bid, preventing excessive spending.

Example: If the highest bid is \$2 and the second-highest bid is \$1.50, the winner might pay in between \$1.50 & \$2.

Summary of Key Points:

First-Price Auction: Pay the amount you bid.

Second-Price Auction: Pay the second-highest bid amount.

Floor Price: Minimum price set by the publisher.

Waterfall Bidding: Sequential bidding from one partner at a time.

Header Bidding: Simultaneous bidding from multiple partners.

Bid Shading: Adjust winning bid to avoid overpaying.

Audiences Types

1.First Party Audience

These audiences are created from data collected directly from your own sources, such as website visitors, app users, or customer email lists. This data helps advertisers retarget users who have shown interest in their products or services. It's highly relevant and controlled by the advertiser, but can be limited in size for new or small businesses.

2.Second-Party Data Audiences

Second-Party Data Audiences are data shared between two companies or partners. One company shares its first-party data with another to expand targeting options. This is useful when their audiences overlap, such as in partnerships or collaborations. Examples include data shared between publishers and advertisers or complementary businesses.

While second-party data provides access to high-quality, relevant data not available from your own sources, you don't have full control over it, and it's more limited compared to first-party data.

3.Third-party audience

Third-Party Data Audiences are audience segments created from data collected by external providers, such as online behavior, demographics, or interests. Advertisers use this data to target a larger and more diverse audience across various platforms. While it helps reach broad audiences, it can be less accurate, more expensive, and may raise privacy concerns. DSPs (DV360) allows the use of data from third-party data providers, which offer pre-built audiences segments based on various characteristics like demographics, interests, and online behaviour. Advertisers can use these segments to target users who match their desired criteria.

4.Affinity Audience

Affinity Audiences are groups of people who share similar interests, lifestyles, or behaviours. They are typically created based on users' long-term habits, such as the websites they visit, the content they engage with, or their activities. Advertisers use affinity audiences to target individuals who have shown a consistent interest in specific topics or categories, like sports, travel, or fashion, making it easier to reach people likely to be interested in their products or services

5.In-Market Audience

In-Market Audiences are groups of people who are actively researching or considering purchasing specific products or services. These audiences are formed based on recent behaviours, such as browsing relevant websites, comparing prices, reading reviews, or showing intent to make a purchase. Advertisers use in-market audiences to target users who are currently in the decision-making phase of their buying journey,

making them more likely to convert. Unlike affinity audiences, which are based on long-term interests, in-market audiences focus on users' immediate purchasing intent.

6.Custom Audience

Custom Audiences are audience segments created by advertisers using their own data, such as customer email lists, website visitors, or app users. These audiences can be based on specific behaviours like previous interactions, purchases, or browsing activity. Advertisers use custom audiences to target users who have already shown interest in their brand, enabling more precise and effective retargeting. It helps in improving ad relevance and increasing conversion rates, but is limited by the available data.

7.Custom Intent Audience

Custom Intent Audiences are groups of users created based on their recent online behaviour and search activity. Advertisers define these audiences by selecting specific keywords, URLs, or actions that indicate users are actively researching or considering a product or service. This helps target users who are closer to making a purchase decision, increasing the likelihood of conversion.

8.Look A Like Audiences

Lookalike Audiences are a targeting strategy where advertisers reach new people who share similar characteristics, behaviours, and interests with their best existing customers. By using machine learning, platforms identify individuals that resemble your top-performing audience, making it more likely they will engage or convert. This helps advertisers expand their reach efficiently and increase the chances of higher ROI.

9.Retargeting Audiences

Retargeting Audiences involve targeting people who have previously interacted with your brand but didn't complete a desired action, like making a purchase. By using tracking technologies (such as cookies), advertisers can show ads to these individuals as they browse other sites, encouraging them to return and finish the action (e.g., buying a product or signing up). It's an effective way to re-engage potential customers who have already shown interest in your brand.

Summary for each audience type:

First-Party Audiences: Data collected directly from your own sources like websites and apps, providing highly relevant and controlled targeting.

Second-Party Audiences: Data shared between two companies, typically based on first-party data, giving access to high-quality data from a trusted partner.

Third-Party Audiences: Data collected by external providers, offering large, diverse audiences but with lower accuracy and higher cost.

Affinity Audiences: Users grouped based on long-term interests or lifestyle behaviours, ideal for targeting broad, consistent interests.

In-Market Audiences: Users actively considering or researching products, making them highly relevant for targeting potential buyers close to a purchase.

Custom Audiences: Audiences built from your own data (e.g., email lists, website visitors), offering precise targeting based on your business's specific needs.

Lookalike Audiences: New users similar to your existing customers, expanding reach by targeting individuals with similar behaviours or demographics.

Custom Intent Audiences: Users who show active intent to buy based on recent online behaviour or search activity, targeting ready-to-buy customers.

Retargeting Audiences: Users who have interacted with your brand previously, bringing them back to convert after initial engagement.

Day parting

It is the strategy of scheduling ads to be shown during specific times of the day or days of the week, based on when the target audience is most likely to engage or take action.

This helps increase ad relevance, reduce wasted impressions, and improve the overall return on investment (ROI).

For example, a brand selling breakfast items might schedule ads during morning hours and a TV streaming service might target evenings when users are more likely to be watching shows.

In summary, dayparting helps ensure that ads are shown to the right audience at the right time to maximize effectiveness and efficiency.

Frequency Cap

Frequency Cap is a setting that limits the number of times an ad is shown to the same user within a specific time such as per day or per week.

It helps prevent ad fatigue, ensuring users aren't overwhelmed by seeing the same ad repeatedly. Controls the number of impressions per user, potentially improving conversion rates.

Reach

Reach is the total number of times your ad is shown to people, including the same person seeing it multiple times.

Reach helps you understand the total number of exposures.

Example: If your ad is shown to 100 people and each person sees it 3 times, your reach is **300** (100 people × 3 views).

Unique Reach

Unique reach is similar to reach but specifically counts each individual only once, regardless of how many times they see the ad. This metric ensures you're not counting the same person multiple times.

Unique Reach tells you how many different people saw your ad.

Example: If 100 people saw your ad and each person saw it 3 times, your unique reach is still 100 because it only counts each person once.

So, Unique Reach is always smaller or equal to Reach, as it doesn't count repeated views from the same person.

Summary:

Frequency Capping: Limits how many times one person can see your ad within a specific time period.

Reach counts all views of your ad, including multiple views by the same person.

Unique Reach only counts each person once, no matter how many times they saw your ad.

Ecosystem

User visits a web page: When a user visits a website, ad slots are available alongside the content, providing opportunities to display ads.

Publisher's ad server: The process starts by checking if there is premium inventory available. If no premium inventory is available, it moves to the Supply-Side Platform (SSP), which helps the publisher manage their ad space.

SSP and Data Management Platform (DMP): The SSP collects data from a Data Management Platform (DMP), which holds valuable user data, such as demographics and behavioural details (age, gender, interests, etc.).

Passing data to the Ad Exchange: Once the SSP has the user data, it sends this information to the Ad Exchange, which connects it with multiple advertisers.

DSP and Targeting: Advertisers use the Demand-Side Platform (DSP) to set targeting parameters for their campaigns, such as interests, location, or behaviours. The DSP compares these parameters with the user's data from the SSP.

Bidding and Ad Display: If there's a match between the advertiser's targeting criteria and the user's data, the highest bid is placed. The ad with the most relevant match is then shown to the user.

Summary of Programmatic Advertising Stakeholders/Elements:

Stakeholder	Role	Example
Advertisers	Purchase and target ads to promote their products/services	E-commerce platform
Publishers	Provide ad inventory on their websites/apps	News websites
DSP (Demand-Side Platform)	Advertisers use DSPs to purchase ad inventory across multiple exchanges	Google DV360, The Trade Desk
SSP (Supply-Side Platform)	Publishers use SSPs to sell their ad inventory to the highest bidder	Magnite, PubMatic
Ad Exchanges	Facilitate RTB between DSPs and SSPs to match buyers with sellers	Google AdX, OpenX
DMP (Data Management Platform)	Collect and manage data to optimize targeting	Adobe Audience Manager

Stakeholder	Role	Example
Ad Server	Store and deliver ads to users and track ad performance	Google Campaign Manager
Creative Agencies	Design and create ad creatives for campaigns	Digital marketing agency
Consumers (Users)	Interact with ads and contribute to data collection	Online shoppers
Verification Companies	Verify ad viewability, fraud detection, and measurement	Moat, DoubleVerify
Attribution Providers	Track user journey and determine ad performance	Adjust, AppsFlyer
Privacy and Compliance Tools	Ensure privacy law compliance (GDPR, CCPA)	OneTrust, TrustArc

Ad Network

An Ad Network is a platform that acts as an intermediary between advertisers and publishers. It aggregates ad inventory from multiple publishers and offers it to advertisers in bulk.

The network handles the ad serving, targeting, optimization and providing a simplified solution for advertisers to reach a wide range of publishers.

Google Display Network (GDN), Media.net, and AdSense are examples of ad networks.

Ad Exchange

An Ad Exchange is a digital marketplace where advertisers and publishers buy and sell ad inventory in real-time, often via programmatic bidding. It facilitates the automated buying and selling of ad space through an auction process.

Google AdX (Google's Ad Exchange), OpenX, and Rubicon Project are

examples of ad exchanges where advertisers bid for available inventory from publishers.

VPAID and VAST

VPAID (Video Player-Ad Interface Definition)

VPAID is a standard which enables interactive experience for video ads. It allows additional interactive elements, such as clickable buttons and overlays, providing a more engaging user experience.

It allows video ads to include additional interactive elements such as clickable buttons and overlays to providing a more engaging user experience

Example: A video ad that appears with an interactive "Skip" button, or an ad that opens a website when clicked is typically using the VPAID format.

VAST (Video Ad Serving Template)

VAST is a simple, XML-based standard used to deliver video ads to be played within video players. It provides a common protocol for communication between ad servers and video players, ensuring consistency across devices and platforms.

VAST primarily focuses on delivering video ads, but it does not include interactive elements. VAST enables video ad serving across multiple publishers, networks, and devices while maintaining standardization and compatibility.

Example: A simple pre-roll ad that plays before the content on a website or streaming platform, where the user does not interact with the ad, would typically use the VAST format.

Key Differences Between VPAID and VAST:

Criteria	VPAID	VAST
----------	-------	------

Type of Ads	Interactive video ads with advanced features	Non-interactive video ads (pre-roll, mid-roll, etc.)
Interaction	Supports interactive features (e.g., clicks, overlays)	No interactive elements, typically just video
Flexibility	More flexible, can integrate with rich media	Less flexible, used for straightforward ad delivery
Complexity	Requires more complex integration	Simpler and easier to implement
Use Case	Engaging, interactive ads with advanced tracking	Basic video ads that play before, during, or after content

Summary:

VPAID is used for interactive video ads, providing more dynamic and engaging ad experiences, with features like overlays and clickable actions.

VAST is used for serving standard, non-interactive video ads, focusing on consistent delivery across devices and platforms.

Click Macro

A click macro is a dynamic placeholder in an ad's URL, which gets replaced with actual data when a user clicks on an ad, allowing advertisers to track and analyze user interactions.

Click macros are inserted in the URL of an ad's destination link. When the user clicks on the ad, the click macro is replaced with real-time data (e.g., user ID, campaign ID, timestamp).

Example:

Let's say you are tracking an ad click to your website. A click macro could look like this:

```
https://www.example.com/?ad_id={ad_id}&user_id={user_id}
```

When the user clicks the ad, the macros `{ad_id}` and `{user_id}` will be replaced with the actual values, for example:

```
https://www.example.com/?ad_id=12345&user_id=67890
```

This enables tracking of the specific ad click and user interaction.

Discrepancy

A discrepancy in advertising is a difference between the data reported by different systems or platforms involved in the advertising process. This can occur when there is a mismatch between the numbers reported by an ad server, a third-party tracking system, a DSP (Demand-Side Platform), or an SSP (Supply-Side Platform).

Example:

Ad Server Report: Shows that there were 10,000 impressions.

Third-Party Tracking System Report: Shows 9,800 impressions.

Reason: The ad server might have counted impressions based on how it logs events, while the third-party tracking system might have excluded invalid impressions (such as those from bots or proxy servers).

Creatives

1. Display Ads

Static or animated banner/visual ads displayed/shown on web pages or apps. These can be static (images) or animated (JPG, PNG, GIF, HTML5).

Examples: Banner ads, sidebar ads, and pop-ups.

2. Video Ads

Ads that include video content and are often placed before, during, or after content on platforms like YouTube (MP4, MOV, AVI).

Examples: Pre-roll, mid-roll, and post-roll ads.

3. Native Ads

A Native ad that blends with the content and format of the platform where it is displayed, providing a user experience that aligns with the overall look and feel of the content or webpage.

It can be found in various formats, such as sponsored articles, promoted social media posts, recommended content widgets, and in-feed ads.

4. Audio Ads

Ads delivered via audio on streaming platforms or podcasts.

Examples: Spotify ads, podcast sponsorships.

5. Interactive Ads

Ads that encourage user interaction, such as clicking, swiping, or answering questions.

Examples: Polls, quizzes, gamified ads.

6. Rich Media Ads

Rich Media Ads are interactive and engaging ad formats that include elements like videos, animations, games, or forms within the ad itself. These ads allow users to interact with the content, often resulting in higher engagement and more memorable experiences.

Examples include expandable banners, interactive video ads, ads with clickable elements that lead to further content or actions, floating ads and interactive carousels.

7. Augmented Reality (AR) Ads

Interactive ads that use AR technology to superimpose virtual elements onto real-world environments via mobile devices.

Examples: Virtual try-ons (e.g., trying on makeup or clothes virtually).

Usage: Excellent for product trials and increasing consumer engagement with physical products.

Display Ad Sizes in Programmatic Advertising:

Ad Size Name ▾	Dimensions (in pixels) ▾	Used Device Types ▾
Leaderboard	728 x 90	Desktop, Tablet
Medium Rectangle	300 x 250	Desktop, Tablet, Mobile
Wide Skyscraper	160 x 600	Desktop, Tablet
Skyscraper	120 x 600	Desktop
Rectangle	180 x 150	Desktop, Tablet, Mobile
Mobile Banner	320 x 50	Mobile
Large Mobile Banner	320 x 100	Mobile
Square	250 x 250	Desktop, Tablet, Mobile
Billboard	970 x 250	Desktop, Tablet
Half Page Ad	300 x 600	Desktop, Tablet
Full Banner	468 x 60	Desktop, Tablet
Smartphone Banner	320 x 50	Mobile
Interstitial	Varies, often 320x480	Mobile
Pop-Up/Pop-Under	Varies (often 800x600)	Desktop
Large Leaderboard	970 x 90	Desktop, Tablet
Responsive Ads	Dynamic (adjusts size)	Desktop, Tablet, Mobile
Video Ad	Varies (e.g., 640x360)	Desktop, Tablet, Mobile

Mobile Ad Sizes:

1.Mobile Banner

Size: 320 x 50 px

Device: Mobile (Smartphones)

Description: A small horizontal ad placed at the top or bottom of mobile screens.

2.Large Mobile Banner

Size: 320 x 100 px

Device: Mobile (Smartphones)

Description: Larger version of the mobile banner for improved visibility.

3. Medium Mobile Rectangle

Size: 300 x 250 px

Device: Mobile (Smartphones)

Description: Common ad format on mobile devices, usually placed within content or as a pop-up.

4. Mobile Interstitial

Size: 320 x 480 px

Device: Mobile (Smartphones)

Description: A full-screen ad that appears between content or app transitions.

5. Mobile Full-Screen Banner

Size: 480 x 320 px

Device: Mobile (Smartphones)

Description: Full-screen banner ads that appear in mobile apps or websites.

6. Native Mobile Ad

Size: Varies by platform (often 300 x 250 px or 320 x 50 px)

Device: Mobile (Smartphones)

Description: Ads that match the look and feel of the app or website's content.

7. Vertical Video

Size: 1080 x 1920 px

Device: Mobile (Smartphones)

Description: Full-screen video ads often used on social platforms like Instagram and TikTok.

Desktop Ad Sizes:

1. Leaderboard

Size: 728 x 90 px

Device: Desktop, Tablet

Description: Horizontal ad placed at the top of web pages.

2. Medium Rectangle

Size: 300 x 250 px

Device: Desktop, Tablet, Mobile

Description: A versatile ad format often placed in content areas or sidebars.

3. Large Rectangle

Size: 336 x 280 px

Device: Desktop, Tablet

Description: A larger version of the medium rectangle that provides more space.

4. Skyscraper

Size: 120 x 600 px

Device: Desktop

Description: A tall, vertical ad placed on the side of webpages.

5. Wide Skyscraper

Size: 160 x 600 px

Device: Desktop

Description: A wider vertical ad for greater visibility and interaction.

6. Half Page

Size: 300 x 600 px

Device: Desktop, Tablet

Description: A larger ad providing more space for visuals and content.

7. Billboard

Size: 970 x 250 px

Device: Desktop, Tablet

Description: A large banner ad typically placed at the top of webpages for high visibility.

8. Panorama

Size: 980 x 120 px

Device: Desktop, Tablet

Description: A wide banner ad often used for impactful messaging.

9.Rectangle

Size: 180 x 150 px

Device: Desktop, Tablet

Description: A small rectangular ad used in sidebars or within content.

Video Ad Sizes:

1.In-Stream Video Ads

Size: 1920 x 1080 px (Full HD) or 1280 x 720 px (HD)

Device: Desktop, Tablet, Mobile

Description: Video ads that play before, during, or after content on video platforms.

2.Vertical Video Ads

Size: 1080 x 1920 px

Device: Mobile (Smartphones)

Description: Full-screen vertical video ads, popular on social platforms like Instagram, TikTok, etc.

3.Square Video Ads

Size: 1200 x 1200 px

Device: Mobile (Smartphones)

Description: Square-format video ads used for social media platforms like Facebook and Instagram.

Key Ad Formats:

Display Ads: JPG, PNG, GIF, HTML5

Video Ads: MP4, MOV, AVI

Rich Media Ads: HTML5, Flash (less common today)

Summary

Desktop Ads are typically larger in size (e.g., Leaderboard, Wide Skyscraper) and are shown on bigger screens.

Mobile Ads are smaller to fit the limited screen space on smartphones and include formats like Mobile Banner and Smartphone Banner.

Tablet Ads can vary in size but are often similar to desktop ads (e.g., Medium Rectangle, Billboard) but adjusted for the tablet's screen size.

Responsive Ads dynamically adjust their size based on the device they are displayed on, ensuring an optimal experience for the user.

Data Management Platform (DMP)

Data Management Platform is a software/technology platform used to collect, organize, and analyse large sets of user data from various sources. DMPs enable advertisers, publishers and marketers to centralize, segment and activate audience data for more effective targeting and personalized advertising.

Types of Reports

1.Pacing Reporting in Programmatic Advertising

Pacing reporting tracks an ad campaign's progress over time in relation to its budget and goals. It helps determine if the campaign is on track to meet its objectives by the end of the campaign period.

Pacing reporting helps ensure that campaigns are running at the intended speed and reaching targets as planned. It prevents under-delivery or over-delivery, ensures efficient budget use, and provides the opportunity to adjust settings to ensure the campaign stays on track for its goals. For example, if a campaign is not delivering enough impressions, adjustments may be made to bid strategies, targeting, or creative to accelerate delivery.

Key Metrics Typically Included:

Spend Rate: The amount of budget spent relative to time elapsed. Helps to ensure that the campaign stays on budget.

Impression Delivery: Tracks how many impressions have been delivered compared to the number expected within a given timeframe.

Budget Pacing: The pacing of how the campaign's budget is being spent over time. Are you spending faster or slower than expected?

Time Pacing: Measures whether the campaign is hitting its target impression volume at the right times.

Goal Progress: Tracks how the campaign is progressing toward its KPIs (e.g., conversions, impressions, clicks).

2. Performance Reporting in Programmatic Advertising

Performance reporting helps advertisers track and evaluate the success of their campaigns based on key performance indicators (KPIs). These reports provide insights into how well the ads are performing in terms of engagement, conversions, and overall impact.

Advertisers can use this data to make adjustments to the campaign, optimize creatives, targeting, or budget allocation.

Key Metrics Typically Included:

Impressions: The number of times an ad was displayed.

Clicks: The number of times an ad was clicked.

Click-Through Rate (CTR): The ratio of clicks to impressions, showing how effective the ad is at driving engagement.

Conversions: The number of desired actions (e.g., purchases, sign-ups) taken by users after interacting with the ad.

Cost-Per-Click (CPC): The average cost for each click.

Cost-Per-Mille (CPM): The cost per 1,000 impressions, often used for brand awareness campaigns.

Cost-Per-Acquisition (CPA): The cost of acquiring a customer or achieving a conversion.

Return on Ad Spend (ROAS): Measures the revenue generated from ad spend. (ROAS = Revenue/Ad Spend)

Key Differences Between Performance and Pacing Reporting:

Performance Reporting focuses on **how well** the campaign is performing in terms of achieving goals (e.g., conversions, CTR, ROI).

Pacing Reporting focuses on **how the campaign is progressing** in terms of time, budget, and delivery, ensuring that the ad spend is allocated correctly over the campaign duration.

Both reports are crucial for managing and optimizing programmatic ad campaigns, helping advertisers fine-tune strategies for better results.

DSP (DV360) Hierarchy

1. **Partner Level:** The highest level for managing multiple advertisers, offering control over billing, targeting, and reports.
Example: A digital agency like WPP managing several clients.
2. **Advertiser Level:** Represents individual businesses or brands running campaigns, including brand-specific settings.
Example: McDonald's under a partner agency.
3. **Campaign Level:** A grouping of related insertion orders with shared business goals. It sets overall campaign objectives, budget, and performance tracking.
4. **Insertion Order (IO):** Defines high-level objectives like budgets, dates, and pacing strategies. It organizes multiple line items for easier management.
5. **Line Item (LI):** Specifies targeting, bidding, and inventory for campaign execution.
Example: One line item for mobile, another for desktop video.

6. **Creative:** The actual ad content (banners, videos) linked to line items for delivery and performance tracking.

AND & OR operations work in audience Targeting

In audience targeting, AND and OR operations determine how audiences are combined for campaign targeting, and they significantly impact the number of user IDs included in the target group.

1. AND Operation: The AND operation targets users who are present in all the selected audiences simultaneously.

- It reduces the number of user IDs because it filters users to include only those who meet all criteria across the chosen audiences.

Example:

Audience A: 10,000 users interested in "Sports".

Audience B: 8,000 users interested in "Technology".

AND Condition: Users interested in both "Sports" AND "Technology".

Result: The overlap between Audience A and B might be 2,000 users. So the final target size is 2,000 IDs.

2. OR Operation: The OR operation targets users who are present in either of the selected audiences.

- It increases the number of user IDs because it combines all unique users from both audiences.

Example:

Audience A: 10,000 users interested in "Sports".

Audience B: 8,000 users interested in "Technology".

OR Condition: Users interested in "Sports" OR "Technology".

Result: Unique users across both audiences might be 15,000 (including overlap). So the final target size is 15,000 IDs.

What is a Floodlight pixel?

A floodlight tag is a piece of code generated in Campaign Manager that is placed on a website's individual pages, allowing marketers to track what a user is doing when visiting their site.

Basic checks when your line item is not spending as expected

Basic Checks

- 1. Check Start and End Dates:** Ensure the line item is currently active within the start and end dates set.
- 2. Verify Budget Allocation:** Confirm that both the campaign and line-item budgets are sufficient and that the pacing settings are set to "Ahead" or "Even," as needed.
- 3. Bid Settings:** Ensure that your bid is competitive enough. Low bids may prevent the line item from winning impressions. Try raising the bid to see if it improves delivery.
- 4. Frequency Capping:** Check the frequency cap at the campaign and line-item levels. A strict frequency cap can limit reach. Consider increasing it to allow more impressions per user.
- 5. Targeting Criteria:** Make sure targeting is not too narrow. Look for overly restrictive settings in geolocation, devices, audiences, or other targeting layers. Expand targeting to increase reach.
- 6. Inventory Source:** Review inventory sources (open exchanges, private deals, guaranteed deals). Adding or expanding inventory sources can help if the current settings are too limited.
- 7. Creative Approval Status:** Confirm that creatives are approved and eligible to serve. Paused, disapproved, or pending creatives will prevent the line item from delivering.
- 8. Check for Conflicting Exclusions:** Ensure there are no conflicts between inclusion and exclusion settings (such as geo targeting, device targeting, audience exclusions, etc.) that could limit reach.

Q&A

1. What are the KPIs?

Ans: CPI, CTR, CPA, CPCV, VCR.

Key Performance Indicators (KPIs) in DV360 help advertisers measure the success and effectiveness of their campaigns. Here are some common KPIs used in DV360:

Impressions:

Definition: The total number of times an ad is displayed to a user.

Formula: Impressions = Number of times the ad is displayed.

Click-Through Rate (CTR):

Definition: The ratio of clicks to impressions, indicating the percentage of people who clicked on the ad after seeing it.

Formula: $CTR = (\text{Clicks} / \text{Impressions}) * 100$

Cost Per Mille (CPM):

Definition: The cost of 1,000 impressions.

Formula: $CPM = \text{Cost} / (\text{Impressions} / 1000)$

Cost Per Click (CPC):

Definition: The cost incurred each time a user clicks on the ad.

Formula: $CPC = \text{Cost} / \text{Clicks}$

Cost Per Acquisition (CPA):

Definition: The cost incurred to acquire a customer or lead.

Formula: $CPA = \text{Cost} / \text{Conversions}$

Viewability:

Definition: The percentage of impressions that are actually viewed by users.

Formula: $\text{Viewability} = (\text{Viewed Impressions} / \text{Total Impressions}) * 100$

Conversion Rate:

Definition: The percentage of users who completed a desired action

(e.g., making a purchase) after clicking on the ad.

Formula: $\text{Conversion Rate} = (\text{Conversions} / \text{Clicks}) * 100$

Total Conversions:

Definition: The total number of completed actions or conversions tracked by the advertiser.

Formula: $\text{Total Conversions} = \text{Primary Conversions} + \text{Secondary Conversions}$

Click Conversion Rate:

Definition: The percentage of users who completed a conversion after clicking on the ad.

Formula: Click Conversion Rate = (Conversions / Clicks) * 100

Engagement Rate:

Definition: The percentage of users who engaged with the ad (e.g., by expanding it or interacting with rich media elements).

Formula: Engagement Rate = (Engagements / Impressions) * 100

2. What are the types of reports you work on?

Ans: I have worked on: 1. Pacing Report. 2. Performance report.

1. Pacing Report: In this we will work on spend, How the campaign budget performs for a given time.

2. Performance report: In this we'll work on KPI goals.

3. Ad network and Ad exchangers?

Ans: Ad Network: An ad network is a platform that connects advertisers with a network of publishers. It aggregates ad inventory from multiple publishers and offers it to advertisers. They handle the ad serving, targeting, and optimization, providing a simplified solution for advertisers to reach a wide range of publishers. It acts as an intermediary.

Ad Exchange: An ad exchange is a digital marketplace where ad inventory is bought and sold through real-time bidding (RTB). It facilitates direct transactions between advertisers and publishers, to allow more transparency, control.

4. Difference between Open marketplace and Private market place and Programmatic Guaranteed?

Ans: Open MarketPlace (RTB): Public real-time bidding auctions that are open to all buyers and sellers. In this, advertisers (buyers) and publishers (sellers) participate in auctions where ad inventory is sold in real-time to

the highest bidder. It's a transparent and competitive environment where various advertisers can bid for available ad space, and the winning bid gets the opportunity to display their ad.

Private MarketPlace (PMP): It is an exclusive auction with a curated/selected audience of advertisers selected by publishers. It restricts access to a limited number of advertisers, creating a more controlled and targeted environment. It is a relationship between a specific publisher and a selected group of advertisers.

Programmatic Guaranteed Deal: Programmatic direct deal involves one on one contract between a Publisher and Advertiser. The publisher agrees to offer a fixed number of impressions while the advertiser commits to a pre-negotiated price to procure them.

One advertiser – One Publisher.

5.What are the 1st Price Auction and 2nd Price auction?

Ans: First Price Auction: It's a digital buying model where the winning bidder pays exactly the amount they bid. In this scenario, the bidder is charged the full bid amount.

Second Price Auction: It is a digital buying model where the winning bidder pays an additional \$0.01 above the second-highest bid amount in the auction.

6. What type of optimizations did you work on? (or) You are running a campaign which is not performing well, so can you explain to me what are the steps to troubleshoot (optimize) for non-performing campaigns?

Ans: "When a campaign is not performing well, my first step is to review the targeting parameters and the types of line items used. I compare the performance of different line items to identify which ones are successful and which ones are underperforming. Additionally, I check the site and app reports to pinpoint any websites that are spending a significant portion of the campaign budget but delivering minimal clicks. In such

cases, I exclude those poorly performing websites to improve overall efficiency.

Simultaneously, during performance optimization, I ensure that I manage the campaign budget effectively. This involves checking CPM bids to balance spending. I also analyse performance data to determine which device types and audience segments are performing well and which are not. Likewise, I evaluate the effectiveness of various creatives and prioritize the best-performing ones.

To optimize the campaign, I reallocate the budget to Favor the best-performing creatives, device types, and audience segments. Conversely, I reduce the budget allocated to non-performing elements. This approach helps to maximize the campaign effectiveness and ensures that resources are utilized efficiently."

7. What is Viewability?

Ans: It is the percentage of Ad loading on the user browser, It is a digital advertising metric that measures "seen" impressions essentially. It only reports impressions that can actually be viewed.

$$\text{Viewability} = \text{Viewable Impressions} / \text{Measurable Impressions}.$$

8.What is a Native ad?

Ans: A Native ad that blends with the content and format of the platform where it is displayed, providing a user experience that aligns with the overall look and feel of the content or webpage. It can be found in various formats, such as sponsored articles, promoted social media posts, recommended content widgets, and in-feed ads.

9.What is Vpaid and Vast?

Ans: VPAID (Video Player Ad Interface Definition): VPAID is a standard which enables interactive experience for video ads. It allows additional interactive elements, such as clickable buttons and overlays, providing a

more engaging user experience.

Vast: (Video ad serving template) is a simple format allowing video ads to be played within players at the same time. It provides a common protocol for communication between ad servers and video players. It primarily focuses on delivering video content and tracking impressions, clicks, and other metrics. Unlike VPAID, VAST does not support interactive elements in the same way.

Summary: In summary, VPAID is about creating interactive and engaging video ad experiences, while VAST is more about the standardized delivery and tracking of video ads. They serve different purposes in the video advertising ecosystem.

10. What is DMA?

Ans: DMA (Designated Market Area): DMA stands for Designated Market Area. It represents a specific geographic area where the cost of advertising within a particular DMA is influenced by the number of viewers in that area. Generally, the more viewers the higher the cost of advertising. This metric helps advertisers target specific regions and allocate resources based on market significance.

11. What is Header bidding?

Ans: Header bidding is a system that allows publishers to sell out bids from many demand partners before picking a winner. It's like letting advertisers compete to offer the highest price for ad slots.

12. How the Programmatic ECOsystem works ? OR How does the online bidding process work?

Ans: When a user visits a web page, ad slots load alongside the webpage content, creating an opportunity to display ads. This triggers the publisher's ad server. The first step is to check for any premium inventory availability. If no premium inventory is found, the process moves to the SSP (Supply-Side Platform).

The SSP performs a crucial role by checking the Data Management Platform (DMP) for user behaviour data, including details like age and gender. This information is then passed on to the ad exchanger. On the other side of the ad exchanger, the advertisers are connected through the DSP (Demand-Side Platform).

And here the targeting parameters set on the DSP level by advertisers are compared to the user requirements from the SSP. When they are matched the highest bid is placed, and the most matched ad is shown to the user.

13. How do you run/manage campaigns?

Ans "To manage our campaigns, we maintain a campaign management sheet. Daily, we upload campaign data onto this sheet. Initially, we identify campaigns with zero spends from the previous day, addressing any associated issues. Subsequently we check under-pacing campaigns, to optimize.

Later, we shift our focus to over-pacing campaigns, in this we consider the agreed CPM rates with clients and compare them with our actual CPM rates. Following this, we evaluate both client given KPIs and our internal KPIs. We analyse whether the performance is good or not.

If our performance is good and CPM is in control, we recommend to the account manager that we can enhance the margin in that specific area."

14. Can you tell me what type of trafficking and setup request you get for Ad campaigns?

Ans: Roles and Responsibilities + how do you run campaigns (Refer 13th answer above).

15. Types of campaigns you worked?

Ans: Display and Video campaigns.

16.What are DCM and DMP?

Ans: DCM (DoubleClick Campaign Manager) is an Ad management and ad serving solution that helps agencies and advertisers manage the entire scope of digital advertising programs. This gives better control in tracking, reporting as well as making changes in creatives. DCM is a comprehensive tool that streamlines the planning, execution, and analysis of digital advertising campaigns.

DMP (Data Management Platform) is a software platform used to collect, organize, and analyse large sets of user data from various sources. DMPs enable advertisers and marketers to centralize, segment, and activate audience data for more effective targeting and personalization.

17. I've opened a website on my mobile phone, how would you target me with the same ad on my desktop?

Ans: It is based on the cookies which we loaded on the website so it can make you target whenever you open the same website on a desktop as well.

18.What types of Audiences are listed in DV360?

Ans: First Party Audiences: These audiences are created from the advertiser's own data, such as website visitors, app users or customer Email lists. First party data allows advertisers to retarget users who have shown interest in their products or services.

Third Party Audiences: DV360 allows the use of data from 3rd party data providers, which offer pre built audience segments based on various characteristics like demographics, interests and online behaviour. Advertisers Can use these segments to target users who match their desired/specific criteria.

Affinity Audiences: These audiences are created/formed based on the user's interests in particular topics and are identified by the type of content they actively engage with.

In-market Audiences: This audience segment is created based on their interest in purchasing a specific product or service.

Custom Intent Audiences: Custom intent audiences allow advertisers to create custom audience segments based on specific keywords and URLs related to products or services. This helps target users who are actively searching for specific terms or visiting relevant websites.

Remarketing Audiences: Remarketing audiences are created from users who have previously interacted with the advertiser's website or app.

Lookalike Audiences: Look alike or similar audiences are created based on the characteristics of existing customers or website visitors.

19. What is Audience segmentation? Why is it important?

Ans: Audience segmentation involves focusing on distinct audience groups. By targeting users through segmentation, we gain insights into the performance of each audience segment. This understanding helps us assess spending patterns, budget allocations, impressions generated, and the overall performance delivered by specific audience segments.

20.What is programmatic advertising?

Ans: Programmatic advertising refers to the automated buying, selling, and optimization of digital advertising inventory in real-time through the use of technology and data. It replaces traditional manual processes with automated systems, allowing advertisers to reach their target audiences more efficiently and effectively.

21.What is ads.txt?

Ans: Ads.txt (Authorized Digital Sellers) is an IAB initiative to combat ad fraud by providing a transparent and secure method for publishers to declare authorized sellers of their inventory. It is a text file hosted on a publisher's website that lists the authorized sellers of their digital ad inventory. Advertisers can reference the ads.txt file to verify the legitimacy of the inventory being purchased.

22. What is the difference between affinity and in-market audiences?

Ans: Affinity audiences refer to groups of people who have demonstrated a strong interest or affinity for specific topics or categories over time. These audiences are generally interested in or have a passion for the topic but may not be actively looking to make a purchase.

In-market audiences, on the other hand, consist of people who are actively researching or showing intent to make a purchase in a specific category or industry. They exhibit behaviour that suggests they are in the market for a particular product or service.

23. What is targeting expansion?

Ans: Targeting expansion, also known as similar audiences or lookalike audiences, is a feature in advertising platforms that allows advertisers to reach new audiences who share similar characteristics or behaviours with their existing target audience. The platform analyses the data of the existing audience and identifies other users who exhibit similar traits, expanding the potential reach of the campaign.

24. What is MOAT and Double Verify? What are verification vendors? What do they do?

Ans: MOAT and Double Verify are examples of verification vendors in the digital advertising industry. Verification vendors provide tools and services to ensure brand safety, viewability, fraud detection, and ad

performance measurement. They help advertisers and publishers monitor and optimize their campaigns, detect and prevent fraudulent activities, and ensure that ads are delivered in suitable and viewable environments.

25.What are UTM parameters? Why are they used?

Ans: UTM parameters are tags added to URLs to track and analyze the effectiveness of marketing campaigns and traffic sources. They are commonly used in digital marketing to understand which channels, campaigns, or specific ads are driving traffic, conversions, and other key metrics. UTM parameters typically include parameters such as source, medium, campaign, content, and term.

26. Reasons for high bounce rate?

Ans: A high bounce rate in digital marketing refers to a high percentage of users who leave a website or landing page without interacting further. Several factors can contribute to a high bounce rate, including:

- Irrelevant or mismatched content: If the content or messaging on the page does not align with user expectations or search intent, users may quickly leave.
- Slow page load time: If the page takes too long to load, users may become impatient and exit before engaging with the content.
- Poor user experience: Difficult navigation, confusing layout, or a lack of clear calls-to-action can lead to users abandoning the page.
- Non-mobile friendly design: If the page is not optimized for mobile devices and doesn't provide a seamless experience, users may bounce.
- Misleading ad or clickbait: If the ad or external link leading to the page is misleading or clickbait, users may leave immediately upon arrival.

27. If the line item is not serving? What will you do ?

Ans: If a line item is not serving, it could be due to several reasons, such as:

- **Incorrect targeting settings:** The line item's targeting settings may not match the available inventory or the desired audience.
- **Budget limitations:** The line item's budget may have been exhausted or capped, preventing further ad serving.
- **Ad creative issues:** There may be issues with the ad creative, such as incorrect format, file size, or technical errors.
- **Ad scheduling:** The line item's scheduling settings may not align with the available ad impressions or desired time slots.
- **Ad priority:** The line item's priority level may be lower than other competing line items, causing it to receive fewer impressions.

28. How will you set up a campaign structure?

Ans: Setting up a campaign structure involves organizing and structuring campaigns, ad groups, and creatives in a logical and strategic manner. The specific setup may vary depending on the platform and campaign objectives, but generally involves the following steps:

- Define campaign goals and objectives.
- Identify target audiences and determine appropriate targeting options.
- Set up campaigns and allocate budgets based on objectives and targeting criteria.
- Create ad groups within campaigns, grouping similar products, services, or themes together.
- Develop ad creatives specific to each ad group, ensuring they are engaging and aligned with the target audience.
- Implement tracking pixels or tags to measure campaign performance and conversions.
- Monitor and optimize the campaign structure based on performance data, making adjustments as needed.

29. What formulas do you use when comparing discrepancy reports from a third party?

Ans: When comparing discrepancy reports from a third party, common formulas and calculations used include:

- Discrepancy Rate: $(\text{Third-Party Impressions} - \text{Platform Impressions}) / \text{Third-Party Impressions}$
- Discrepancy Percentage: $\text{Discrepancy Rate} * 100$
- Platform Share: $\text{Platform Impressions} / \text{Third-Party Impressions}$
- Lost Impressions: $\text{Third-Party Impressions} - \text{Platform Impressions}$

30. Why do impression discrepancies occur?

Ans: Impression discrepancies can occur due to several factors, including:

- **Different counting methodologies:** Ad platforms and third-party measurement systems may use different counting methodologies, leading to variations in reported impressions.
- **Ad blocking or ad filtering:** Users may have ad-blocking software or browser settings that prevent ads from being displayed, resulting in discrepancies between served and counted impressions.
- **Caching:** Some intermediaries or ad servers may cache ads, leading to discrepancies in impression counts.
- **Network latency or connection issues:** Technical factors such as network latency or connection issues can cause discrepancies in impression counts between the ad server and third-party measurement systems.
- **Measurement discrepancies:** Different measurement systems may have varying levels of accuracy or sampling methodologies, resulting in differences in reported impressions.

31. How does the cachebuster macro work?

Ans: The cachebuster macro, typically implemented as a random string or timestamp within a tag or URL, ensures that a fresh request is made to

the server each time an ad is served. It prevents the browser or server from caching the ad, ensuring that the latest version of the ad is always displayed to the user. The cachebuster macro acts as a unique identifier, making each ad request unique and bypassing any caching mechanisms.

32. What if the cachebuster macro isn't implemented?

Ans: If the cachebuster macro isn't implemented in the ad tag, the ad may be subject to caching by the browser or server. This means that subsequent ad requests may not fetch the latest version of the ad, leading to potential discrepancies in ad display and measurement. Implementing a cachebuster macro helps ensure that each ad request is unique and avoids caching issues.

33. If an ad isn't displaying as intended, do you create a test page to preview?

Ans: Yes, creating a test page to preview the ad is a common practice to diagnose and troubleshoot display issues. By creating a separate test page, you can isolate the ad from the complexities of the actual website or app, allowing you to focus on identifying and resolving any issues affecting the ad's display. The test page provides a controlled environment for previewing and debugging the ad, ensuring it appears as intended.

34. What is Active View, and how does it work?

Ans: Active View is a technology developed by Google that measures the viewability of digital ads. It determines whether an ad was actually seen by a user, considering factors such as ad placement, scrolling behavior, and browser visibility. Active View measures viewability metrics, such as the percentage of the ad visible on the screen and the duration of time it remains visible. It provides advertisers with insights into the effectiveness and visibility of their ads.

35.What is a cookie?

Ans: A cookie is a small piece of data stored on a user's device by a website that the user visits. Cookies serve various purposes, including remembering user preferences, enabling personalized experiences, and tracking user behaviour for advertising and analytics purposes. Cookies can store information such as login credentials, browsing history, and user interactions. They play a crucial role in digital marketing by allowing advertisers to deliver targeted ads based on user interests and behaviour.
